The UK Parliament has two Houses that work on behalf of UK citizens to check and challenge the work of Government, make and shape effective laws, and debate/make decisions on the big issues of the day.

Looking at and listening to picture and story books is a ubiquitous activity, frequently enjoyed by many young children and their parents. Well before children can read for themselves they are able to learn from books. Looking at and listening to books increases children's general knowledge, understanding about the world and promotes language acquisition. This collection of papers demonstrates the breadth of information pre-reading children learn from books and increases our understanding of the social and cognitive mechanisms that support this learning. Our hope is that this Research Topic/eBook will be useful for researchers as well as educational practitioners and parents who are interested in optimizing children's learning.

Globally, severe asthma is defined by the WHO as either (A) untreated severe asthma; (B) difficult-to-treat severe asthma; and (C) treatment-resistant severe asthma. Untreated severe asthma is a political problem: the children do not have access to the basic tools for asthma management, and when this is corrected, asthma outcomes are transformed. The problem in difficult-to-treat severe asthma is not the airway disease, but co-morbidities and behavioral factors. This is the group in which there are most asthma deaths, underscoring that severe asthma cannot be solely defined by levels of prescribed therapy. Treatment-resistant severe asthma is rare and challenging, and the problem is the airway pathology. These children require new and innovative therapies.

Articles within this e-book are focused on the health of children with disabilities. Various frameworks have been used to articulate the dynamic interaction of the individual, environment and the task as it relates to child health. A majority of the contributing authors in this special topic are researchers within the field of adapted physical activity. This field embraces a broad perspective of inclusiveness and attitudes of acceptance.

The National Children's Study (NCS) is planned to be the largest long-term study of environmental and genetic effects on children's health ever conducted in the United States. It proposes to examine the effects of environmental influences on the health and development of approximately 100,000 children across the United States, following them from before birth until age 21. By archiving all of the data collected, the NCS is intended to provide a valuable resource for analyses conducted many years into the future. This book evaluates the research plan for the NCS, by assessing the scientific rigor of the study and the extent to which it is being carried out with methods, measures, and collection of data and specimens to maximize the scientific yield of the study. The book concludes that if the NCS is conducted as proposed, the database derived from the study should be valuable for investigating hypotheses described in the research plan as well as additional hypotheses that will evolve. Nevertheless, there are important weaknesses and shortcomings in the research plan that diminish the study's expected value below what it might be.

Examine the work of five groundbreaking education theorists—John Dewey, Maria Montessori, Erik Erikson, Jean Piaget, and Lev Vygotsky—in relation to early childhood. Theories of Childhood provides a basic introduction to each theorist and

explains the relationship of theory to practice and its impact on real children, teachers, and classrooms. This edition reflects current academic learning standards and includes new understandings of Vygotsky's work. It is a popular guide to help early childhood professionals be aware of the theories behind good child care practices. It is also a widely-used text in undergraduate programs, community college courses, and training workshops that focus on early development and education. Carol Garhart Mooney has been an early childhood educator for more than forty years. She is also the author of *Theories of Attachment*, *Use Your Words*, and *Swinging Pendulums*.

Children and companion animals seem to have a natural affinity towards each other. Most children desire a relationship with their own companion animals or at least demonstrate an interest to interact with animals in general. Living with companion animals or interacting with animals may have psychosocial, neurobiological, or medically relevant effects on typically developing children and juveniles as well as those with diverse and special needs. In this eBook, we present several articles addressing the relationships between children/juveniles and animals in different countries, including Austria, Germany, Jamaica, Japan, the United Kingdom and the United States. Three articles discuss approaches in animal-assisted education, including animal keeping and animal assisted interventions in schools, and an experimental study investigating immediate effects of dogs on reading competence and accompanying stress reactions with cortisol and behavior. Other articles address topics involving children and their companion animals, including dog-walking by children and juveniles, risks of dog bites by the family dog, selection of pet dogs for families with a child with autism spectrum disorder (ASD) and the relationships that children with ASD have with their family cats. The interactions between children/juveniles and animals addressed in this eBook provide new insights into some scarcely investigated themes, and underline the significance of animals in children's lives.

How children think is one of the most enduring mysteries--and difficulties--of parenthood. The marketplace is full of gadgets and tools that claim to make your child smarter, happier, or learn languages faster, all built on the premise that manufacturers know something about your child's brain that you don't. These products are easy to sell, because good information about how children's minds really work is hard to come by. In their new book, neuroscientists Sandra Aamodt and Sam Wang separate fact from fiction about the inner workings of young minds. Marrying results from new studies and classic research, Aamodt and Wang provide the most complete answers out there on this subject. It liberates readers from superstitions and speculation, such as Freud's idea that all relationships are modeled on one's mother, or that it's not safe to eat sushi while pregnant. And it will reveal new truths about everything from how to make your baby sleep, to why we love to snuggle, to how children learn, forget, play, talk, walk, and feel. *Welcome to Your Child's Brain* is eye-opening and necessary, soon to become a staple for parents and children alike.

This annotated anthology documents historical trends and basic findings regarding music in early childhood education, development, and care. The papers in this volume discuss the main research trends of musical engagement with early children, such as: music in the family, employing music in child care, and musical skill and development. This collection hopes to stimulate further reflections on the implementation of music in daily practice. The volume represents many facets of research from different cultural contexts and reflects trends and projects of music in early childhood. The findings incorporate a historical perspective with regards to different topics and approaches. The book provides practitioners and researchers of music education, music development, and music psychology, an opportunity to read a selection of articles that were previously published in the journal *Early Child Development and Care*. Each paper concludes with an annotation note supplied by the principle author addressing how they see their article from the perspective of today.
