Up for an atomic saga? But first, if little atoms could only talk, just think of the stories they could tell us about our planet and universe. This is a voyage of discovery on a celestial and planetary scale. Seven lovely little atoms are born in the Oort Cloud. They are thrown into a beautiful blue-water planet and are split up. They soon find that this water planet is the best atomic amusement park ever. They will meet and be hosted by many simple and complex life forms. They will suffer through earthquakes, asteroid strikes, thunderstorms, hurricanes, and volcanic eruptions. They will see the best and worst of an emerging mankind. None of them will suffer, and all will have the fun of many lifetimes.

Pollinators--insects, birds, bats, and other animals that carry pollen from the male to the female parts of flowers for plant reproduction--are an essential part of natural and agricultural ecosystems throughout North America. For example, most fruit, vegetable, and seed crops and some crops that provide fiber, drugs, and fuel depend on animals for pollination. This report provides evidence for the decline of some pollinator species in North America, including America's most important managed pollinator, the honey bee, as well as some butterflies, bats, and hummingbirds. For most managed and wild pollinator species, however, population trends have not been assessed because populations have not

been monitored over time. In addition, for wild species with demonstrated declines, it is often difficult to determine the causes or consequences of their decline. This report outlines priorities for research and monitoring that are needed to improve information on the status of pollinators and establishes a framework for conservation and restoration of pollinator species and communities.
